

Data Science & AI Bootcamp – Interview Question Bank

NATURAL LANGUAGE PROCESSING

1. How do you implement text classification?
2. Identify challenges faced in NLP due to ambiguity in language.
3. Explain bag-of-words model.
4. What is tokenization?
5. How do you handle document classification?
6. What are different text preprocessing pipelines?
7. Explain different text representation methods.
8. Explain the concept of word embeddings.
9. Explain different sequence-to-sequence models.
10. Explain sentiment analysis.
11. What role do regular expressions play in text preprocessing?
12. Explain different word embedding techniques.
13. How do you implement spell checking?
14. Explain text similarity measures.
15. Explain stop words and their importance.
16. What is the difference between bag-of-words (BoW) and term frequency-inverse document frequency (TF-IDF) representations?
17. Explain different evaluation metrics for NLP.
18. What is stemming and lemmatization?
19. What is part-of-speech tagging?
20. What are word embeddings?
21. How do you handle out-of-vocabulary words?
22. How do you handle text normalization?
23. What are different document similarity measures?
24. Explain named entity recognition.
25. What is parsing in NLP?
26. Identify common libraries or frameworks used for NLP tasks.
27. Describe part-of-speech (POS) tagging.
28. What is tokenization in NLP?
29. What is topic modeling?
30. Explain different tokenization strategies.
31. What is dependency parsing?
32. How do you implement entity linking?
33. What is TF-IDF?
